

Autonomous Brand Defence (ABD)

Detect impersonation, leaks, and brand abuse, before it spreads. OSINT Scanning

The Problem

Fake domains, impersonation attempts, leaked credentials, and executive exposure often appear on platforms outside your control.

The Shift

An autonomous system that detects and helps remove external threats: from spoofed assets to brand misuse and executive targeting.

What it Covers

ABD monitors your external threat surface for brand and executive impersonation, spoofed domains, executive exposure, and leaked material. It scans social platforms, marketplaces, messaging apps, and dark web forums to track misuse and sentiment shifts. Where possible, it supports takedowns and guides response.

What Makes It Different

Real-time risk signals, not just alerts.

24/7 scanning, dark web, social, messaging apps.

Zero drain on internal resources.

Flags impersonation, leaks, fake domains, & rogue listings.

Early warning on sentiment and executive exposure.

How it works

Track ➤ Detect ➤ Contextualise ➤ Resolve

What you get

Live alerts, no noise. Each threat is contextualised and risk-rated, with clear next steps. You get visibility without extra tooling, and support when a takedown or escalation is needed. No overhead. Just coverage.
